

This print-out should have 8 questions. Multiple-choice questions may continue on the next column or page – find all choices before answering.

001 (part 1 of 3) 10.0 points

Solve the system of linear equations

$$\begin{cases} x - 2y + 3z = -1 \\ 4x + 5y + z = -11 \\ -x + y - 2z = 2 \end{cases}$$

What is the value of z ?

Correct answer: 3.

Explanation:

Write the system in triangular form:

$$\begin{cases} x - 2y + 3z = -1 \\ 4x + 5y + z = -11 \\ -x + y - 2z = 2 \end{cases}$$

Subtract Equation 1 \times 4 from Equation 2:

$$\begin{cases} x - 2y + 3z = -1 \\ 13y - 11z = -7 \\ -x + y - 2z = 2 \end{cases}$$

Add Equation 1 to Equation 3:

$$\begin{cases} x - 2y + 3z = -1 \\ 13y - 11z = -7 \\ -y + z = 1 \end{cases}$$

Add Equation 3 \times 13 to Equation 2:

$$\begin{cases} x - 2y + 3z = -1 \\ 2z = 6 \\ -y + z = 1 \end{cases}$$

Interchange Equation 2 and Equation 3:

$$\begin{cases} x - 2y + 3z = -1 \\ -y + z = 1 \\ 2z = 6 \end{cases}$$

Thus

$$\begin{aligned} 2z &= 6 \\ z &= 3. \end{aligned}$$

002 (part 2 of 3) 10.0 points

What is the value of y ?

Correct answer: 2.

Explanation:

$$\begin{cases} y + z = 1 \\ z = 3 \end{cases}$$

Substitute z into the first equation:

$$\begin{aligned} y + 3 &= 6 \\ y &= 2. \end{aligned}$$

003 (part 3 of 3) 10.0 points

What is the value of x ?

Correct answer: -6.

Explanation:

$$\begin{cases} x - 2y + 3z = -1 \\ y = 2 \\ z = 3 \end{cases}$$

Substitute into the first equation

$$\begin{aligned} x - 2(2) + 3(3) &= -1 \\ x + (5) &= -1 \\ x &= x. \end{aligned}$$

004 10.0 points

Use the quadratic formula to solve

$$-373.5 = 6t - \frac{9}{2}t^2.$$

What is the larger of the solutions?

Correct answer: 9.80146.

Explanation:

Rearranging the equation we get

$$\begin{aligned} \frac{9}{2}t^2 - 6t - 373.5 &= 0 \\ 9t^2 - 12t - 747 &= 0 \end{aligned}$$

$$t = \frac{-(-12) \pm \sqrt{(-12)^2 - 4(9)(-747)}}{2(9)}$$

$$= \frac{12 \pm \sqrt{27036}}{18},$$

with a larger solution of

$$\frac{12 + \sqrt{27036}}{18} \approx \boxed{9.80146}.$$

005 10.0 points

For the given triangles, $a = 39.1$ m, $b = 23.8$ m, and $\alpha = 38.3^\circ$.

Find θ .

Correct answer: 25.6745° .

Explanation:

Let the altitude be x .

In the triangle on the right,

$$\tan \alpha = \frac{x}{b}$$

$$x = b \tan \alpha$$

and in the triangle on the left,

$$\tan \theta = \frac{x}{a} = \frac{b \tan \alpha}{a}$$

$$\theta = \arctan \left(\frac{b \tan \alpha}{a} \right)$$

$$= \arctan \left[\frac{(23.8 \text{ m}) \tan 38.3^\circ}{39.1 \text{ m}} \right]$$

$$= \boxed{25.6745^\circ}.$$

Find the derivative $f'(x)$ for

$$f(x) = 2x^2 + x - 1$$

starting from first principles.

1. $2x - 1$

2. $4x + 1$ **correct**

3. $4x - 1$

4. $2x + 1$

5. Does not exist

Explanation:

$$f(x) = 2x^2 + x - 1$$

and

$$f(x + \Delta x) = 2(x + \Delta x)^2$$

$$+ (x + \Delta x) - 1$$

$$= 2[x^2 + 2x\Delta x + (\Delta x)^2]$$

$$+ x + \Delta x - 1$$

Consider

$$f(x + \Delta x) - f(x) = [2x^2 + 4x\Delta x + 2(\Delta x)^2$$

$$+ x + \Delta x - 1]$$

$$- (2x^2 + x - 1)$$

$$= 4x\Delta x + 2(\Delta x)^2 + \Delta x$$

so that

$$\frac{f(x + \Delta x) - f(x)}{\Delta x} = 4x + 2\Delta x + 1$$

and this limit exists as $\Delta x \rightarrow 0$, so

$$f'(x) = \lim_{\Delta x \rightarrow 0} \frac{f(x + \Delta x) - f(x)}{\Delta x}$$

$$= \lim_{\Delta x \rightarrow 0} (4x + 2\Delta x + 1)$$

$$= 4x + 1.$$

007 10.0 points

What is the integral of $f(x)=x$? Recall that the integral is the inverse of the derivative or that the derivative of $F(x)=f(x)$ (Hint: the derivative of $x^2=2x$).

What is the area under $f(x)$ between $x=-1$ and $x=1$?

1. $F(x)=0.5x^2$; Area = 0 CORRECT

2. $F(x)=0.5x^2$; Area = 1

3. $F(x)=x^2$; Area = 2

4. $F(x)=x^2$; Area = 0

Explanation:

$F(x)=0.5x^2$

Area is equal to zero since below zero the area is negative and above zero the area is positive. The two areas exactly cancel. Or if you evaluate $F(x)$ at the upper and lower limit the difference is zero.

008 10.0 points

A graph of a straight line going through two points is shown below.

What is the equation of this line?

1. $y = \frac{-8}{3}x + \frac{1}{8}$

2. $y = \frac{3}{8}x + \frac{1}{8}$ correct

3. $y = \frac{8}{3}x + \frac{1}{8}$

4. $y = \frac{3}{8}x - \frac{1}{8}$

5. $y = \frac{3}{8}x - \frac{1}{3}$

6. $y = \frac{3}{8}x + \frac{1}{3}$

7. $y = \frac{8}{3}x + \frac{1}{3}$

8. $y = \frac{-8}{3}x - \frac{1}{8}$

9. $y = \frac{-3}{8}x + \frac{1}{8}$

10. $y = \frac{-3}{8}x - \frac{1}{3}$

Explanation:

Let : $(x_1, y_1) = (-3, -1)$
 $(x_2, y_2) = (5, 2)$

The slope is

$$m = \frac{(2) - (-1)}{(5) - (-3)} = \frac{3}{8}$$

Using 2 points

$$(y - y_1) = m(x - x_1)$$

$$y = m(x - x_1) + y_1$$

Therefore,

$$y = \frac{3}{8}(x + 3) - 1$$

$$= \frac{3}{8}x + \frac{1}{8}$$
